

PERFORMANCE-BASED ASSESSMENT RUBRIC

IoT System Project (Expected 50% Completion)

IT 114 — Advanced Human Computer Interaction

1st Semester, AY 2026-2027

System Title: _____

Group Member: _____

Section: _____

Date: _____

Criteria	Excellent	Good	Fair	Poor	Points
Hardware Setup & Functionality <i>Sensor, Microcontroller, Actuator Wiring</i>	(30-24) Sensor and microcontroller are fully wired and functioning, producing accurate real-time readings. Actuator wiring/logic is already implemented or clearly planned with a working test.	(23-18) Sensor and microcontroller are wired and mostly functioning with minor inconsistencies in readings. Actuator plan exists but implementation has not yet started.	(17-12) Sensor or microcontroller connection is unstable or only partially working. Readings are inconsistent or incomplete. Actuator plan is vague or missing.	(11-0) Hardware is not wired, non-functional, or no readings can be produced. No clear actuator plan exists.	
Code / Data Flow Implementation <i>Microcontroller Programming</i>	(20-16) Code compiles and runs without errors. Sensor data is read and processed correctly and consistently.	(15-12) Code compiles and runs with minor bugs. Sensor data is read but occasionally inaccurate or inconsistent.	(11-8) Code has significant errors affecting functionality. Sensor data is read but processing logic is incomplete.	(7-0) Code does not compile or run, or sensor data is not being read or processed at all.	
UI / Dashboard Progress <i>Figma-to-Implementation</i>	(25-20) At least one core screen from the Figma design is implemented and fully navigable, closely matching the approved wireframe.	(19-15) Core screen is implemented but has minor layout inconsistencies with the approved wireframe.	(14-10) Screen implementation is incomplete or significantly deviates from the approved wireframe.	(9-0) No screen has been implemented, or the implementation is unusable.	
Alignment with Approved Proposal <i>Title, Rationale, Hardware Table</i>	(15-12) System fully matches the approved title, rationale, and hardware components. Any changes are clearly documented and justified.	(11-9) System mostly matches the approved proposal, with minor unexplained deviations.	(8-6) System has noticeable deviations from the approved proposal that are not clearly explained.	(5-0) System significantly differs from the approved proposal, with no explanation given.	
Documentation & Progress Tracking <i>GitHub Commit History</i>	(10-8) Code is pushed to GitHub with a clear, consistent commit history. Group can explain their progress in detail.	(7-6) Code is on GitHub but with a limited commit history. Group can explain most of their progress.	(5-4) Code is uploaded late or with minimal commit history. Group has difficulty explaining their progress.	(3-0) No GitHub repository or documentation submitted. Group cannot explain their progress.
